# Why scripting?

Why would anyone want to know how to write a script?

Why is it particularly important for a sysadmin?

Here are 7 reasons to consider:

1. avoid complex typing, preventing possible errors
2. automate repetitive tasks
3. use when an alias gets too complex or not possible
4. make new, specialized commands
5. automate long and/or complex tasks
6. handle rare but complex activities
7. create a "wrapper" for a program

These are all valid reasons, especially for a sysadmin managing a Linux/Unix server on behalf of an enterprise. The reasonable use of scripting will make you more productive, more accurate, and more efficient, increasing your value to your employer.

# Production Examples

- ▶ **gunzip**
  - vi `which gunzip`
- ▶ **vimtutor**
  - vi `which vimtutor`

# test program examples

- ▶ man test (three categories of simple test)
  - tests about files
    - is it a file or a directory
    - is it executable?
    - does it have its SUID bit set?
  - tests about strings
    - is it a null string?
    - is one string equal to another?
    - is one string alphabetically before or after?
  - tests about numbers?
    - equal to, less than, greater than?

# combining tests together

- ▶ building complex tests from simple tests
- ▶ test1 -a test2
  - both test1 and test2 must be true
- ▶ test1 -o test2
  - at least one must be true
- ▶ ! test1
  - test1 must be false
- ▶ (test1)
  - true if test1 is true

# numbers versus strings

- ▶ numbers and strings are not the same
- ▶ "00" is not the same as "0" (as strings)
  - one has two characters, the other has one character
  - how can they be the same?
  - if your pin number is 0037 and someone tries, 37, should it work?
  - as strings, "0037" is not the same as "37" so, no, it shouldn't work
- ▶ = and != and < and > are for STRINGS

# Numbers versus Strings

- ▶ numbers and strings can't be mixed
- ▶ 00 is the same as 0 (as numbers)
- ▶ 005 is the same as 05 and 5 (as numbers)
- ▶ it's an error to ask if the number 0 is the same as the number xyz (error: there is no such number xyz)
- ▶ -eq -ne -gt -lt -ge -le are for NUMBERS
- ▶ 0 -eq xyz #gives ERROR, xyz not a NUMBER

# || and &&

- ▶ We have already seen `&&` in action:
  - `[ -f $HOME/.bashrc ] && . $HOME/.bashrc`
  - `[ -z "$PS1" ] && return`

- ▶ And we've seen these are equivalent to

```
if [ -f $HOME/.bashrc ]; then
    . $HOME/.bashrc
```

```
fi
```

**and**

```
if [ -z "$PS1" ]; then
    return
```

```
fi
```

# && means "and"

- ▶ Suppose you might qualify for a scholarship:
- ▶ Those who qualify are:
  - eight feet tall, and ??
  - born on the moon, and ??
  - algonquin student and ??
- ▶ or in other words
  - eight feet tall && ??
  - born on the moon && ??
  - algonquin student && ??
- ▶ In which case do we need to find out what ?? is?

# && continued

- ▶ With "and", we need to keep going as long as we keep encountering "true"
- ▶ As soon as we encounter "false", we can stop
  - `born on the moon && ?? # we don't care about ??`
  - `algonquin student && ?? # we need to know ??`
- ▶ In the first case, we would not do the ?? command, whatever it is
- ▶ In the second case, we would do the ?? command, whatever it is
- ▶ Often we don't need the exit status of the command ??, we just wanted the command to run (or not)

# || means "or", opposite of &&

- ▶ As soon as we encounter "true", we can stop
- ▶ You qualify for a \$1000 rebate under the following conditions:
  - born on the moon, or ??
  - algonquin student, or ??
- ▶ In the first case, we need to know what the exit status of the ?? is, we need to run the ?? command
- ▶ In the second case, we can stop before running the ?? command

# && and || in general

- ▶ aa && bb
  - means if aa; then bb; fi
- ▶ aa || bb
  - means if not aa; then bb; fi

# Checking Lottery Numbers

- ▶ You have six numbers, and six numbers are drawn randomly
- ▶ When you're checking the numbers, is it `&&` or `||` that governs when you stop checking?

first number matches `&&`  
second number matches `&&`  
third number matches `&&`  
..etc...

# Is your name on a list?

- ▶ After you try out for the basketball team, the list of people who made the team is posted.
- ▶ When you're checking for your name on the list, which of `&&` or `||` governs when you stop checking?

first name on the list is yours `||`

second name on the list is yours `||`

third name on the list is yours `||`

...etc...

# && versus -a, || versus -o

- ▶ && and -a both mean "and"
  - && is used between commands
  - -a is used between expressions in the test command
  
- ▶ || and -o both mean "or"
  - || is used between commands
  - -o is used between expressions in the test command

# && and || versus -a and -o

- ▶ && and || are used with commands that tend to get things done
  - to graduate, you
    - complete first year && complete second year
  - complete first year is a "command" that gets things done: you learn the first-year material
- ▶ -a and -o are used in test, and don't do things, just affect the exit status of test
  - you are a rich canadian if
    - you are canadian -a you are rich
  - checking whether or not you're canadian doesn't get things done – but it does establish a truth value

# Rich Canadian

- ▶ If we used &&, we'd be getting things done
- ▶ become a Canadian && earn \$1000000
- ▶ When it comes to trying to be a rich Canadian, if we fail to become Canadian, we don't need to bother earning \$1000000
